

For this project I did not use any outside resources for the main project. I used mostly my notes from in class for help because the examples were more specific to the problems than the readings were. I have used one of my deadline extensions because I had trouble creating the data map because I was unclear on what files to use for map_data in the main function. I also didn't know whether we were supposed to have the graphs print out in the main function, so I just assigned both the graph and the map to a variable. I was confused by the Piazza question about the correct position of the month and day, so I just left the code to use the format mm/dd/yyyy. Overall, I enjoyed this project because it allowed me to visually analyze the data that I was working with last project and see a practical application to sorting the data like in project 3.
